Concept/Thesis Proposal

Concept/Final Defense

Proposed Title: AIMS: A Mobile-Based Academic Internship Management System for the College of Information Technology and Computing (CITC) at University of Science and Technology (USTP–CDO)

Proponents:Fenandez, Harry S.Inidal, Faisal R.Lopez, Maikent George C.Naïve, Varren Meg M.Pajo, Henna Christine C.

- Introduction of Examination Committee Member
- Session Flow
- Presentation Proper
- Defense Proper
- Panel Deliberation

After the presentation of the Concept Presentation Defense of Fenandez, Harry S., Inidal, Faisal R., Lopez, Maikent George C., Naïve, Varren Meg M., and Pajo, Henna Christine C., the examination committee members gave their comments/suggestions to enhance the proposed study.

Comments from Engr. Ulrich Lee F. Uy, MSIT,

- He advised the proponents to review all proposed system features and ensure that only feasible and achievable functionalities will be included in the study. Features that may not be completed within the given timeframe should be removed or minimized.
- He recommended focusing on the essential and practical functionalities for the system to avoid making the project scope too broad.
- He suggested adding a notification feature that alerts students regarding missing internship requirements or documents.
- He also recommended including due dates and deadline tracking functionalities for document submissions and internship requirements.

- The proposed system should remain mobile-based as stated in the title and objectives of the study.
- The system should include a checklist and file status monitoring feature to help students track completed and pending internship requirements.
- The system should provide internship monitoring functionalities to assist coordinators in supervising student internship progress and activities.
- The system should implement timestamping of submissions to record the exact date and time documents are uploaded or submitted.
- The system should include a submission history tracking feature for monitoring previous document submissions and updates.
- The system should support document submission management for organized uploading, storing, and handling of internship requirements.
- The system should include a dashboard feature that displays important internship-related information and analytics.
- The dashboard should provide statistical summaries for internship records and student deployment data.
- The system should support report generation for coordinators and administrators to easily produce internship-related reports.
- The dashboard should include tracking reports to monitor student progress, requirement completion, and internship performance.
- The panelist noted that the current scope of the study is too large and advised the proponents to narrow and refine the system scope to ensure successful implementation.

Comments from Prof. Marylene S. Eder, MIT,

- She stated that the proposed system currently lacks monitoring accuracy and data-driven performance evaluation features.
- She requested the proponents to revisit and revise the Statement of the Problem to better align with the actual issues experienced in internship management.
- She pointed out that CITC already has an existing web-based internship system; therefore, the claim regarding “manual document handling causing slow processing” may no longer be fully valid.
- She advised the proponents not to heavily highlight manual processes since existing web-based systems already address some of those concerns.
- The panelist emphasized the importance of focusing on the technical innovation of the proposed study and identifying features that distinguish it from existing systems.
- She advised the proponents to focus on the impact and benefits of the system for internship coordinators, career center personnel, and department deans.
- She highlighted the absence of centralized monitoring in the current system and recommended focusing on how the proposed system can improve centralized internship management.

- She emphasized improving monitoring accuracy of submitted documents through the mobile-based platform.
- The panelist recommended integrating data-driven functionalities for internship performance monitoring and evaluation.
- She suggested identifying and emphasizing the missing functionalities or limitations of the existing web-based system, particularly in document processing and internship monitoring.
- She suggested identifying the limitations of the current web-based system, particularly the processes and decisions that cannot currently be performed effectively.
- She emphasized that the study should clearly explain what the existing system cannot do and how the proposed system addresses those gaps.
- She remarked that the group consists of five members and noted that the proposed scope and number of features are too extensive.
- She emphasized the importance of focusing on smaller but impactful features rather than implementing too many complex functionalities.
- Monitoring accuracy was highlighted as one of the major limitations of the current internship management system.
- She asked where the existing internship data is currently stored.
- The proponents answered that the data is stored in Amazon Web Services (AWS), and that the previous system owner would provide the source code to the current developers.
- She also asked where current OJT students upload or submit their documents.
- The proponents responded that students still use physical documents for submission and processing.
- She recommended applying the recommendations and improvements identified from the previous version of the study.
- She suggested gathering actual internship data so the proposed system can be utilized and tested by the next batch of OJT students.
- The proponents were advised to focus more on improving the internship process rather than adding excessive system features.
- She remarked that the proposed system is relevant and useful since she also has prior experience as an OJT coordinator.
- She advised the proponents to focus on reducing document processing time and improving efficiency.
- The panelist suggested implementing time stamp monitoring features, if applicable, to improve monitoring accuracy.
- She also recommended adding communication or messaging functionalities, if feasible, to support coordination among stakeholders.
- The proponents were advised to conduct another interview with OJT coordinators or stakeholders to further identify actual problems that can be transformed into system features.

- The panelist suggested including features that can track late submissions, undeployed students, delayed deployments, missing documents, and due date notifications for OJT coordinators.
- She emphasized that the study should focus on solving the current problems experienced by OJT handlers and coordinators.
- The panelist stated that the signature detection feature is unnecessary and may be removed from the proposed system.
- The panelist reminded the proponents not to propose overly ambitious features that may not be achievable within the project scope and timeframe.

Comments from Ms. Loredel B. Tamayo,

- The group conducted a consultation meeting with Ms. Loredel Tamayo regarding the concept presentation. As instructed by the group's instructor, the purpose of the meeting was to gather possible feedback or insights from her as a panelist since Ms. Tamayo is absent during the concept presentation.
- Ms. Tamayo stated that she had no additional comments or concerns regarding the group's work. She said everything was okay and had already been discussed the details with the instructor. No further issues were raised, and the meeting concluded shortly after.

Decision of the panel: **Approved**, subject to revisions based on the comments, suggestions, and recommendations of the panel members.
